1. The function g is defined on the closed interval $[-4, 8]$. The graph of g consists of two linear pieces and a semicircle, as shown in the figure above. Let f be the function defined by $f(x) = 3x + \int_0^x g(t) dt$

(a) Find $f(7)$ and $f'(x)$

$$f(7) = 3(7) + \int_0^7 g(t) dt$$

$$f(7) = 21 - \frac{1}{2}\pi(3)^2 + 1(3) \quad (\text{Good Enough})$$

$$f(7) = 24 - \frac{9}{2}\pi$$

$$f'(x) = 3 + g(x) \cdot x'$$

$$f'(x) = 3 + g(x)$$

$$f'(7) = 3 + g(7)$$

$$f'(7) = 3 + 3 \quad (\text{Good Enough})$$

$$f'(7) = 6$$

- (b) Find the value of x in the closed interval $[-4, 3]$ at which f attains its maximum value. Justify your answer.

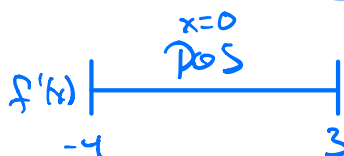

$$f'(x) = 3 + g(x)$$

$$0 = 3 + g(x)$$

$$-3 = g(x)$$

$\therefore x = 3$ is a critical value

$\nearrow x = 3$ is also an end value.

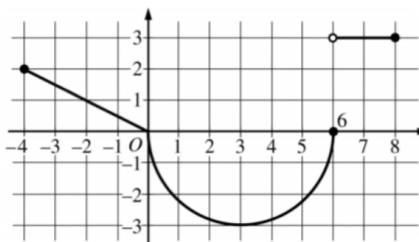

$\therefore f' > 0$ on $[-4, 3]$

$\therefore f$ is increasing on $[-4, 3]$

$\therefore f(x)$ has a maximum at $x = 3$

$$f(x) = 3x + \int_0^x g(t) dt$$

- (c) For each of $\lim_{x \rightarrow 0^-} g'(x)$ and $\lim_{x \rightarrow 0^+} g'(x)$, find the value or state that it does not exist.

$$\lim_{x \rightarrow 0^-} g'(x) = -\frac{1}{2} + 1$$

what is the slope of $g(x)$ from left of 0?

$$\lim_{x \rightarrow 0^+} g'(x) \text{ does not exist} + 1$$

(vertical tangent line)

what is the slope of $g(x)$ from left of 0?

(d) Find $\lim_{x \rightarrow -2} \frac{f(x) + 7}{e^{3x+6} - 1}$

$$\begin{aligned} \lim_{x \rightarrow -2} (f(x) + 7) &= \lim_{x \rightarrow -2} \left(3x + \int_0^x g(t) dt + 7 \right) \\ &= 3(-2) + \int_0^{-2} g(t) dt + 7 \\ &= -6 - \int_{-2}^0 g(t) dt + 7 \\ &= -6 - 1 + 7 \\ &= 0 \end{aligned}$$

$$\begin{aligned} \lim_{x \rightarrow -2} (e^{3x+6} - 1) &= e^{3(-2)+6} - 1 \\ &= e^0 - 1 \\ &= 1 - 1 \\ &= 0 \end{aligned}$$

+1

L'Hopital's Rule

$$\lim_{x \rightarrow -2} \frac{f(x) + 7}{e^{3x+6} - 1} = \lim_{x \rightarrow -2} \frac{f'(x)}{3e^{3x+6}} = \frac{f'(-2)}{3e^{3(-2)+6}} = \frac{3+g(-2)}{3e^0} = \frac{3+1}{3 \cdot 1} = \frac{4}{3} + 1$$

NO CALCULATOR IS ALLOWED FOR THIS QUESTION.

2. Unless otherwise specified, the domain of a function f is assumed to be the set of all real numbers x for which $f(x)$ is a real number.

$$f(x) = \begin{cases} \sqrt{9-x^2} & -3 \leq x \leq 0 \\ -x + 3 \cos\left(\frac{\pi x}{2}\right) & 0 < x \leq 4 \end{cases}$$

Let f be the function defined above.

- (a) Find the average rate of change of f on the interval $-3 \leq x \leq 4$.

$$\begin{aligned} \text{ARC} &= \frac{f(-3) - f(4)}{-3 - 4} \\ &= \frac{0 - (-1)}{-7} \\ \text{ARC} &= -\frac{1}{7} \end{aligned}$$

+1

SIDE WORK (NOT Required)

$$\begin{aligned} f(-3) &= \sqrt{9 - (-3)^2} \\ &= \sqrt{9-9} \\ &= \sqrt{0} \\ f(-3) &= 0 \end{aligned}$$

$$\begin{aligned} f(4) &= -4 + 3 \cos\left(\frac{\pi \cdot 4}{2}\right) \\ &= -4 + 3 \cos(2\pi) \\ &= -4 + 3 \cdot 1 \\ f(4) &= -1 \end{aligned}$$

- (b) Write an equation for the line tangent to the graph of f at $x = 3$

POT	SOT	Tangent line
$f(3) = -3 + 3 \cos\left(\frac{3}{2}\pi\right)$ $f(3) = -3 + 3 \cdot 0$ $f(3) = -3$	$f'(x) = -1 - 3 \sin\left(\frac{\pi x}{2}\right) \cdot \frac{\pi}{2}$ $f'(3) = -1 - \frac{3\pi}{2} \sin\left(\frac{3}{2}\pi\right)$ $= -1 - \frac{3\pi}{2}(-1)$ $f'(3) = -1 + \frac{3\pi}{2}$	$y + 3 = (-1 + \frac{3\pi}{2})(x - 3)$

+1

(c) Find the average value of f on the interval $-3 \leq x \leq 4$ (CALC for this part)

$$\begin{aligned}
 \text{Average Value} &= \frac{1}{4 - (-3)} \int_{-3}^4 f(x) dx \\
 &= \frac{1}{7} \left[\int_{-3}^0 f(x) dx + \int_0^4 f(x) dx \right] +1 \\
 &= \frac{1}{7} \left[\frac{9\pi}{4} - 8 \right] +1
 \end{aligned}$$

(d) Must there be a value of x at which $f(x)$ attains an absolute maximum on the closed interval $-3 \leq x \leq 4$? Justify your answer.

$$\begin{aligned}
 \text{I)} & f(0) = 3 \quad \therefore f(x) \text{ is defined at } x=0 \\
 \text{II)} & \lim_{x \rightarrow 0^-} f(x) = 3 = \lim_{x \rightarrow 0^+} f(x) \quad \therefore \lim_{x \rightarrow 0} f(x) \text{ exists} \\
 \text{III)} & f(0) = \lim_{x \rightarrow 0} f(x) \\
 & \therefore f(x) \text{ is continuous at } x=0 \\
 & \therefore f(x) \text{ is continuous on } [-4, 3]
 \end{aligned}$$

+1

\therefore The Extreme Value Theorem guarantees f attains an absolute maximum on $[-3, 4]$ +1
